FARM EMPLOYMENT DOWN 4 PERCENT FROM YEAR AGO

There were 10,608,000 people working on farms throughout the country on the first of this month, the U. S. Department of Agriculture reported today. This is a decline of 7 percent from July 1, which is usually a peak period of farm employment, and is 4 percent less than on August 1 a year ago. It is also 6 percent below the 1935-39 August average.

All sections of the country reported declines in total farm employment from a year ago, with the sharpest drops reported for New England and the South Atlantic Region. The number of unpaid family workers for the country as a whole (including farm operators) was about the same on the first of August as a year earlier; however, hired farm employment decreased from 2,962,000 to 2,694,000 or about 9 percent between these two dates. Hired workers represented about 25 percent of the total farm labor force, the smallest percentage for the month in nearly a decade. The employment of paid workers declined most in the South with the South Atlantic Region showing a decrease of 17 percent in hired workers from August 1, 1943 to August 1, 1944. The North Central States also showed marked declines in numbers of paid workers with the regional estimate 11 percent lower than for the same date last year.

Workers brought into New England from Kentucky, Jamaica, and Newfoundland for seasonal work are proving to be of substantial help to farmers in some areas.

New York dairymen are finding it difficult to secure help by the day or week to assist in the hay harvest. This difficulty has, of course, prolonged haying with a resultant loss in feed value of the crop. So far, through the use of high school boys and girls, prisoners of war, urban workers, migrants, and imported workers from Jamaica and the Bahamas, sufficient labor has been secured to take care of crops that must be harvested within a short period. Few canning crops have been lost as a result of the labor situation.

As a general rule, most of the New Jersey growers had enough potato pickers by mid-July. After the close of the asparagus harvest around July 1, approximately 2,000 Jamaicans and Bahamians in the labor camps became available for work in the intensive truck crop section of the State, harvesting beans, corn, tomatoes, fruits and other commodities. These workers plus the southern migrants coming into the

State, appear to have largely met the requirements for labor. Also, some crops, such as sweet corn and lima beans, were cut by the dry, hot weather, thus somewhat diminishing the demand for farm labor.

A smaller production of canning and truck crops than had been anticipated lowered expected peaks in requirements for the Ohio harvest. Hybrid seed corn tasseled very short this year, simplifying and speeding up detasseling. The excellent harvesting weather through July permitted rapid advancement of small grain harvest -- with little time lost by combines or threshing crews.

Cultivating was generally all out of the way in Illinois by mid-July as was the harvest of all small grains except oats. Oats harvest extended well up to the end of July in northern Illinois and in scattered areas elsewhere, where shock threshing is common. Hay harvest and baling and the baling of straw were still progressing on August 1. Harvest of redbud and timothy seed got under way early in July and carried over into August. Peach harvest will extend into September. For corn detasseling in connection with hybrid seed production, at least one company hired a large group of Jamaicans who proved very satisfactory for the work.

Oat harvest got under way in most areas in Michigan as the harvest of big crops of hay and wheat were practically completed. The supply of labor for the fruit season appears to be greater than a year ago. Harvest of the largest cherry crop in the State's history is about over without significant losses. These major tests on the farm labor supply situation indicate that most of the remaining crops will be harvested without appreciable loss. Peach and onion harvest will use a large labor force during August.

The work on Wisconsin farms is being handled ^{rather well} by fewer persons this year. However, the harvesting of cherries in Door County was made somewhat difficult by the inadequacy of both picking labor and plant labor during the early part of the season. Recently with the importation of foreign labor and the recruiting of youth this problem has been satisfactorily handled. New methods of using machinery and the working together of neighborhood groups have gone a long way toward getting the work accomplished.

In North Dakota it appears that if the weather does not interfere too much, the grain harvest will be handled fairly satisfactorily. Mexican Nationals are being brought in and have already been placed on farms throughout the eastern part of the State, and there are some transient workers coming up from Southern States and adjoining States. In addition, a great deal of assistance will result from the large number of outside combines that are moving into the State at this time.

Labor for grain harvest has apparently been sufficient in most parts of Nebraska as a large number of transient combines moved into the State. Considerable plowing has been done since the wheat harvest. Mexican Nationals and prisoners of war are being used rather extensively in the irrigated areas for work on potatoes and sugar beets and to some extent on fruit harvest. Wild hay harvest is in full swing and there is need for additional hay hands in these areas.

A considerable number of workers have moved in from other States to aid in harvesting the Kansas wheat crop which has been seriously delayed by interference from rain. This was especially true of the western third of the State. Reports from some parts of this area showed a fourth to a third of the wheat crop still to be cut on August 1.

South Atlantic Region: In some sections of Virginia wheat is still standing in the shock because of inability to get threshing help. In part, the problem is being overcome by farmers exchanging labor with one another. Workers to help harvest the commercial peach crop were recruited from towns and cities and wherever they could be found and the peach harvest passed its peak by August 1.

Sufficient orchard help is on hand to pick West Virginia peaches in all areas except in Berkeley and Jefferson Counties where considerable difficulty is reported in obtaining pickers. In these areas, growers who have both apples and peaches will probably have enough regular workers to take care of these crops. About 500 foreigners are going into the State to help with the harvest and probably also some prisoners of war.

An unusual farm labor situation existed in North Carolina during June and July. The excessive dry weather minimized the need of labor for cultivation. It also prevented much preparation for and planting of crops like soybeans as succession crops which are usually planted in June and July following small grains and truck crops. In fact, for the first time in years both labor and work stock were largely inactive in field work during late June and early July. The mid-July general rains came too late to permit further cultivating of most crops.

Farm activity in Florida at present is probably at the season low. Land preparation, seedbed planting for fall vegetables, fertilizing, pruning, spraying, and cultivation of citrus groves, are the main labor consuming farm activities in central and south Florida. In the field crop areas, late crops have been laid by and tobacco harvested, but it is still a little early for cotton picking or peanut digging to get underway.

In Tennessee, Alabama, and Mississippi, farm-operations were rather restricted the first of August, but farm activity in Arkansas was increased following the drought-breaking rains during the latter part of the month. Cotton was progressing well in these States at the turn of the month.

In Oklahoma the peak of the summer work load has passed with the completion of threshing and laying-by of corn and other row crops.

Farm work was active in Texas around the first of the month as the weather was hot and dry and favorable for field work. Small grain harvest was largely completed, with just a little threshing yet to be done. Harvesting of grain sorghums in the commercial belt in Southern counties was about finished and cotton picking is general in these counties. Some corn was ready for harvest in Southern counties by August 1 but the crop was not being harvested to any considerable extent. Stubble fields are being plowed following completion of small-grain harvest. The harvest of hay and feed crops is general over the State. Small grain harvest was completed with no losses through lack of machinery or labor.

Mountain Region: Demand for harvest labor in Montana will soon be at a high level as grain harvesting is starting. Oats and barley are being cut with binders and some winter wheat is being combined. The second cutting of alfalfa hay is starting as well as the cutting of wild hay. Sweet cherry picking will be completed about the tenth of the month. Harvesting of dry peas has also started.

In Idaho completion of early summer jobs, such as blocking and thinning beets, cherry picking, lettuce cutting, and early pod pea harvest, eased the demand for new help. This let-down was somewhat offset by the beginning of early potato

harvest and the necessity of additional hoeing of row crops. Shifting of some crews of Mexicans to take up the slack has occurred. The apricot harvest has passed the peak in late districts. In North Idaho, transients working their way home and east from Pacific Coast war plants have added to the available supply of harvest labor.

The wheat, oats, and barley harvests in Arizona have been completed, mostly by July 15. Cantaloups and watermelons are reaching the end of the season run. A few fields of onions are still to be harvested. Potato shipments were becoming light by August 1, and only a few cars will go out after August 5. Hay harvesting is in a lull during the hot weather. Regular farm workers are employed at various odd tasks while the truck crop seasonal workers are for the most part on Indian reservations or in towns. Irrigation and cultivation are the main jobs being done on the cotton crop at present.

As of August 1, the heavy demand in Utah for piece workers in harvesting red raspberries, cherries, and apricots was practically over, although the first two weeks of August will still require a considerable number of cherry pickers. In northern areas, by August 1, the second cutting of alfalfa was nearing completion and in southern areas, the third cutting was almost completed. Harvest of wheat and barley was just coming into the peak. Sugar beets generally have attained enough growth to require a minimum of cultivation but a maximum need for careful attention to irrigation.

Pacific Region: Farm operations being performed in Western Washington include the start of the second cutting of hay, harvest of processing peas, canberries except blackberries, sour cherries, some vegetable seeds, early potatoes, and summer truck crops. In Central and Eastern Washington the harvest of winter wheat is at a peak; harvest of spring grains and field peas is general; harvest of canning corn is beginning; apricot and summer apple harvests are past the peak; cutting the second crop of hay and the harvest of early and intermediate potatoes, tomatoes, and cantaloups are beginning. The cultivating of sugar beets, corn, and other row crops and the thinning and heavy spraying of apples is coming to a close.

The principal farm activities in California now requiring large numbers of hired workers are the harvest of various seasonal vegetable crops, citrus in Southern California, apricots (crop is late and large this year), peaches, plums, early grapes and pears, potatoes in the Delta, Riverside County and a few other localities, hay cutting and baling, completion of grain crop harvest. Reports from over the State indicate that the labor supply is generally adequate in terms of numbers, but much of it is rather inefficient. The Farm Labor Office reports about 13,000 volunteers working the last week of July. Only a few local shortages of farm labor are now reported and these are mostly in connection with the harvest and cutting of apricots.

Farm employment and related data, United States, August 1, 1944,
